

FUNCTIONAL BONDING

The kit functional bonding creates an electrical bonding between panels and posts, solving problems with leakage current. It can be used together with the Smart Fix system, where a washer is added to the Smart Fix bolt that will scratch the paint on the panel. This will lead to better contact with the metal to lead the current.

As the Smart Fix system is based on metal brackets and installed with the standard mesh panels and the 60x40 posts, with this solution, it's possible to create a functional bonding throughout the system.
